

Amendments to the Specification

Please amend the specification as follows.

Please amend paragraph [0022] beginning at page 4, line 19, as follows:

[0022] In the process of reaching the present invention, the inventors had initially thought that, if a phenomenon peculiar to a fluid that occurs utilizing the variable speed in the fluid as the energy of it is superimposed upon the slit fluid jet flow, a stable fluid film will be formed. Based on this idea, the inventors have conceived the fact that a detached vortex, which appears in the flow at the back of a substance and which is typically represented by a von-Karman vortex, periodically occurs due to the existence of the variable speed component.
